

1 Practice and Applications

Exercise 1. Consider the matrix

$$A = \begin{pmatrix} 5 & 3 \\ 3 & 5 \end{pmatrix}$$

- (a) Find the characteristic polynomial of A
- (b) Find the real eigenvalues of A
- (c) For each real eigenvalue, find an associated eigenvector.

Exercise 2. Let A the matrix in Exercise 1.

- (a) Verify that the eigenvectors you found in Exercise 1 form a basis, α , for \mathbb{R}^2 .
- (b) Compute $[A]_\alpha$.

Exercise 3. Corollary 3.5.20 guarantees that any matrix with two distinct eigenvalues is diagonalizable. Explain why you would expect this to be the case based on our geometric interpretation of eigenvalues and eigenvectors.

Definition. Let A be the 2×2 matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

we define the *transpose of A* , denoted A^T , by

$$A^T = \begin{pmatrix} a & c \\ b & d \end{pmatrix}$$

Exercise 4. Are the eigenvalues of A the same as the eigenvalues of A^T ? If so, why? If not, give a counterexample.

Exercise 5. Are the eigenvectors of A the same as the eigenvectors of A^T ? If so, why? If not, give a counterexample.

Exercise 6. Let A be the 2×2 matrix

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

with the property that $a + b = c + d$.

- (a) Prove that $\begin{pmatrix} 1 \\ 1 \end{pmatrix}$ is an eigenvector of A .
- (b) Find all eigenvalues of A .

Exercise 7. Let A be the 2×2 matrix

$$A = \begin{pmatrix} .4 & 1 - c \\ .6 & c \end{pmatrix}$$

- (a) What are the eigenvalues of A ? (They will depend on c).
- (b) Show that A only has one eigenvector if $c = 1.6$.
- (c) When $c = 0.8$, then A^n will approach what matrix as n becomes very large?

Exercise 8. Look back at some examples and compare the sum of the eigenvalues of a given matrix to the sum of the entries along the diagonal of the matrix. Compare the product of eigenvalues to the product of entries along the diagonal. What might you conjecture to be true? (Try and prove your conjecture(s).)
